GlobalGLO
Low Carbon Solutions™

GlobalGLO Low-Carbon Solutions™: How our program works

Meeting today's energy demands while reducing emissions is a business imperative that serves the environment and your company's competitive edge.

GlobalGLO™ is a suite of ready-to-implement fuel products and consultative services that make it easy to do just that. These diverse offerings give Global's customers the ability to adapt to regulatory changes, market conditions and customer preferences - putting the power in your hands to be an energy leader.

GlobalGLO™ offers compensated fuels solutions that pair traditional and/or low-carbon fuels with Voluntary Carbon Offsets (VCOs) that Global procures and retires to help your business reach its targets.

Contact us today and let us help you fuel the future, sustainably:

LEARN MORE:

Low Carbon Fuels

Low-Carbon Fuels can minimize environmental impacts, providing reduced emissions compared to conventional refined products that can be measured over a product's lifecycle and contribute to your company's overall sustainability plan.

Renewable Diesel

Drop-in solution, no modifications required

Made from a wide range of fats, oils and waste products

Ethanol

Commonly blended into gasoline at ~10-15% as an oxygenate to enhance combustion

Used in Flex Fuel vehicles as E85 (85% blend), a non-gasoline alternative fuel

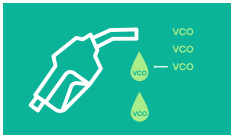
Biodiesel

Blended into diesel fuel or used as a standalone

Department of Energy and Agriculture found biodiesel reduces net carbon dioxide emissions by 78%

How Voluntary Carbon Offsets Work

Carbon emissions result from activities using fossil fuels. When organizations want to reduce emissions, they can decide to use lower carbon fuels and/or purchase Voluntary Carbon Offsets (VCOs).



Voluntary Carbon Offsets (VCOs) may be purchased on their own. GlobalGLO Low Carbon Solutions™ offers fuels used every day paired with high quality, verified VCOs.

VCOs are used to fund third-party certified projects aimed towards the removal of carbon or prevention of new carbon in the atmosphere.

Once a certified project has completed its intended goal, the carbon offsets are retired to ensure that those credits are not double counted.
